

ImportFormDataAndCreateBarcodes:

This sample program shows how to import data into a form that contains several AcroForm fields that have calculations and format scripts including barcodes.

Below are simple text input fields. Their values match what is shown on the document.

Company:
First Name:
Last Name:
Address:
City:
State:
Zip Code:

Below are text fields with formatting scripts attached to them. Enter both positive and negative values to see how the formatting is affected. The values of the fields are only visible while editing the field, the result of the format script is what is used to generate the appearance of these fields on the document.

Formatted Number:
Number as String:

Below is a text field that is calculated and formatted based on the two numbers you entered above.

Calculated Field:

Below are two barcode fields. Barcode fields are simply text fields with barcode appearances. The value of barcode fields are always calculated even though that is not apparent in the Acrobat user interface. For this reason, the sample must run both calculation and format scripts for all fields in order to present the data correctly in the document.
